

MARK SCHEME

1	(a)	W: Si $\text{SiCl}_4 + 2\text{H}_2\text{O} \rightarrow \text{SiO}_2 + 4\text{HCl}$ X: P $\text{PCl}_5 + \text{CH}_3\text{COOH} \rightarrow \text{POCl}_3 + \text{CH}_3\text{COCl}$ OR $3\text{CH}_3\text{COOH} + \text{PCl}_3 \longrightarrow 3\text{CH}_3\text{COCl} + \text{H}_3\text{PO}_3$	[4]
	(b) (i)	$\text{Al}_2\text{O}_3(\text{s}) + 2\text{NaOH}(\text{aq}) \rightarrow 2\text{Na}[\text{Al}(\text{OH})_4](\text{aq}) + \text{H}_2\text{O}(\text{l})$ OR $\text{Al}_2\text{O}_3(\text{s}) + 2\text{OH}^-(\text{aq}) \rightarrow 2[\text{Al}(\text{OH})_4]^- (\text{aq}) + \text{H}_2\text{O}(\text{l})$	[3]
	(b) (ii)	On addition of $\text{HCl}(\text{aq})$, a white ppt is formed. Ppt would dissolve in excess $\text{HCl}(\text{aq})$ to give a colourless solution.	
	(c)	BaCO_3 has a higher thermal decomposition temperature. Ba^{2+} has a larger ionic radius compared to $\text{Z}^{2+}/\text{Mg}^{2+}$. Ba^{2+} hence has a lower charge density, and polarise the CO_3^{2-} anion to a lower extent (compared to $\text{Z}^{2+}/\text{Mg}^{2+}$), and the C–O bonds are weakened to a smaller extent, resulting in a higher thermal decomposition temperature.	
	(d)	The 3p electron to be removed from Al is at a higher energy level compared to the 3s electron to be removed from Mg, hence the p electron is less strongly attracted to the nucleus and require less energy to remove.	[1]
		[Total: 9]	

2	(a) For pH = 3.5 $[H^+] = 10^{-3.5} = 3.16 \times 10^{-4} \text{ mol dm}^{-3}$ Let the number of moles of C_5H_5NHCl be $Y \text{ mol}$ Since $pK_a = 5.25$, $K_a = 10^{-5.25} = 5.62 \times 10^{-6}$ $(3.16 \times 10^{-4})^2 / Y - (3.16 \times 10^{-4}) = 5.62 \times 10^{-6}$ $Y = [(3.16 \times 10^{-4})^2 / 5.62 \times 10^{-6}] + (3.16 \times 10^{-4})$ $= 0.0181 \text{ mol}$ <u>Or</u> $(3.16 \times 10^{-4})^2 / Y = 5.62 \times 10^{-6}$ $Y = [(3.16 \times 10^{-4})^2 / 5.62 \times 10^{-6}]$ $= 0.0178 \text{ mol}$ Mass to be added = $(0.0181 \times (12.0 \times 5 + 1.0 \times 6 + 14.0 + 35.5)) \div 0.98$ $= 2.13 \text{ g (or } 2.10 \text{ g)}$	[3]
	(b) $[C_5H_5N] = [(0.100 \times 0.025) - (0.0125 \times 0.005)] / 0.03 = 0.0813 \text{ mol dm}^{-3}$ $[\text{pyridinium chloride}] = (0.0125 \times 0.005) / 0.03 = 2.08 \times 10^{-3} \text{ mol dm}^{-3}$ $pK_b = 14 - pK_a = 8.75$ $pOH = pK_b + \lg [\text{salt}]/[\text{base}]$ $pOH = 8.75 + \lg (2.08 \times 10^{-3} / 0.0813) = 7.16$ $pH = 14 - 7.16 = 6.84$	[3]
	(c) On addition of a <u>small amount of acid</u> (H^+) to the buffer solution, nearly all the <u>added H^+ ions are neutralised</u> by the large amount of C_5H_5N. Hence $[H^+]$ does not increase appreciably and the pH is kept approximately constant. $C_5H_5N (aq) + H^+(aq) \rightarrow C_5H_5NH^+(aq)$ On addition of a <u>small amount of base</u> (OH^-) to the buffer solution, nearly all the <u>added OH^- ions are neutralised</u> by the large amount of $C_5H_5NH^+$. Hence $[OH^-]$ does not increase appreciably and the pH is kept approximately constant. $C_5H_5NH^+ (aq) + OH^-(aq) \rightarrow C_5H_5NH (aq) + H_2O(l)$	[3]
	[Total: 9]

4	(a)	(i)	Comparing Experiments 1 and 2, When the volume/concentration of HCl increases to 1.5 times, rate increases to 1.5 times. Hence, reaction is first order with respect to HCl. Comparing Experiments 1 and 3, When the volume/concentration of sucrose doubles, rate doubles. Hence, reaction is first order with respect to sucrose.	[2]
		(ii)	Rate = k [sucrose] [HCl] From Experiment 1, [sucrose] = $0.850 \times \frac{20}{50} = 0.340 \text{ mol dm}^{-3}$ [HCl] = $1.23 \times \frac{30}{50} = 0.738 \text{ mol dm}^{-3}$ $k = \frac{1.77 \times 10^{-3}}{(0.340)(0.738)} = 7.05 \times 10^{-3} \text{ mol}^{-1} \text{ dm}^3 \text{ min}^{-1}$	[2]
		(iii)	[sucrose] = $0.850 \times \frac{40}{70} = 0.486 \text{ mol dm}^{-3}$ [HCl] = $1.23 \times \frac{20}{70} = 0.351 \text{ mol dm}^{-3}$ Both concentrations for Initial rate of reaction = $7.05 \times 10^{-3} \times 0.486 \times 0.351$ $= 1.20 \times 10^{-3} \text{ mol dm}^{-3} \text{ min}^{-1}$	[2]
	(b)	(i)		[1]

		(ii)	When [sucrose] is low, reaction is first order with respect to sucrose due to the <u>availability of active sites on the enzyme molecules for binding.</u> When [sucrose] is high, all active sites on the enzyme molecules are <u>occupied.</u> The rate of reaction then is independent of [sucrose] and the <u>reaction is zero order</u> with respect to sucrose.	[2]
(c)	(i)		[1]	
	(ii)	The zwitterions of aspartame form <u>ion-dipole interactions</u> with water.	[1]	
	(iii)		[3]	
		[Total: 14]		

5	(a)	Due to the <u>similar energy/ close proximity of the 3d and 4s electrons</u> in the transition elements, transition element can form ions of approximately the similar stability by losing different number of electrons.	[1]
	(b)	In the presence of octahedral <u>ligand field</u> , the <u>degenerate d-orbitals in the metal complex were split into two energy levels</u> . The colour observed is due to the difference in energy levels, ΔE . The <u>difference in electronic configuration due to different oxidation state affect ΔE</u> . <u>Light of different energies/ different wavelengths are absorbed for the promotion of electrons from the lower energy orbital to the vacant/partially filled higher energy orbital/ d-d transition</u> , different complementary colour is observed.	[2]
	(c)	$E^\ominus(\text{Mn}^{3+}/\text{Mn}^{2+})$ is <u>more positive</u> than $E^\ominus([\text{Mn}(\text{CN})_6]^{3-}/[\text{Mn}(\text{CN})_6]^{4-})$, which shows that Mn^{3+} is <u>more readily reduced</u> , hence a weaker oxidising agent in cyanide solution than in water. <u>More energy is required to add an electron to the negatively charged $[\text{Mn}(\text{CN})_6]^{3-}$ due to repulsion</u> .	[2]
	(d)	(i) Figure 1.1	[1]
	(ii)	Since $[\text{Mn}(\text{CN})_6]^{3-}$ ions are red, the <u>energy gap between the 2 sets of d-orbitals in $[\text{Mn}(\text{CN})_6]^{3-}$ is bigger</u> . This suggests that $[\text{Mn}(\text{CN})_6]^{3-}$ is the low spin complex, as its <u>energy gap, ΔE, is greater than the pairing energy/ Coulombic repulsion/ repulsion energy</u> , electrons in $[\text{Mn}(\text{CN})_6]^{3-}$ would pair up.	[1]
	(e)	(i) $[\text{O}] \text{HMnO}_4^- \rightarrow \text{MnO}_4^- + \text{H}^+ + \text{e}$ $[\text{R}] 3\text{H}^+ + 2\text{e} + \text{HMnO}_4^- \rightarrow \text{MnO}_2 + 2\text{H}_2\text{O}$ Overall equation: $3\text{HMnO}_4^- + \text{H}^+ \rightarrow \text{MnO}_2 + 2 \text{MnO}_4^- + 2\text{H}_2\text{O}$	[1]
		(ii) $E_{\text{cell}} = +2.10 - (+0.90) = +1.20 \text{ V}$ $\Delta G = -nFE_{\text{cell}} = -(2)(96500)(1.20) = -232 \text{ kJ mol}^{-1}$	[2]
	(f)	In acidic condition, $\text{O}_2 + 4\text{H}^+ + 4\text{e} \rightleftharpoons 2\text{H}_2\text{O} \quad E^\ominus = +1.23 \text{ V}$ $\text{Mn}^{3+} + \text{e} \rightleftharpoons \text{Mn}^{2+} \quad E^\ominus = +1.54 \text{ V}$ $E^\ominus_{\text{cell}} = +1.23 - (+1.54) = -0.31 \text{ V}$	[2]

		In alkaline solution, $\text{O}_2 + 2\text{H}_2\text{O} + 4\text{e}^- \rightleftharpoons 4\text{OH}^- \quad E^\ominus = +0.40 \text{ V}$ $E^\ominus_{\text{cell}} = +0.40 - (+0.18) = +0.22 \text{ V}$ Since the $E^\ominus_{\text{cell}} > 0$ in alkaline environment and $E^\ominus_{\text{cell}} < 0$ in acidic environment, <u>Mn(II) is more stable in acidic environment than in alkaline environment.</u>	
			[Total: 12]

6	(a)	(i)	CO ₂ : Carbon in CO ₂ has attained maximum oxidation state. N ₂ : N≡N is very strong resulting high activation energy.	[2]
		(ii)	Methane: $\text{CH}_4(\text{g}) + 2\text{O}_2(\text{g}) \rightarrow \text{CO}_2(\text{g}) + 2\text{H}_2\text{O}(\text{l})$ Hydrogen sulfide: $\text{H}_2\text{S}(\text{g}) + 1\frac{1}{2}\text{O}_2(\text{g}) \rightarrow \text{SO}_2(\text{g}) + \text{H}_2\text{O}(\text{l})$ Hydrogen: $\text{H}_2(\text{g}) + \frac{1}{2}\text{O}_2(\text{g}) \rightarrow \text{H}_2\text{O}(\text{l})$	[2]
		(iii)	Energy evolved = $200 \times 4.18 \times (64.7 - 29.6) = 29.34 \text{ kJ}$ mass of biogas used = $1000 \times 6.44 \times 10^{-4} = 0.644 \text{ g}$ Fuel value of biogas = $29.34 \div 0.644 = 45.6 \text{ kJ g}^{-1}$	[2]
		(iv)	Amount of methane in 1 dm ³ biogas = $0.644 \times 0.722 \div (12.0 + 4.0)$ = 0.0291 mol Amount of H ₂ S in 1 dm ³ biogas = $0.644 \times 0.012 \div (2.0 + 32.1)$ = 0.000227 mol Amount of H ₂ in 1 dm ³ biogas = $0.644 \times 0.027 \div 2.0$ = 0.00869 mol Energy evolved = 29.34 kJ = $(0.0291 \times \Delta H_c(\text{CH}_4)) + (0.000227 \times 482) + (0.00869 \times 386)$ $\Delta H_c(\text{CH}_4) = -890 \text{ kJ mol}^{-1}$	[2]
	(c)		- Longer time for hot flue gas to pass through spiral copper coil - Spiral copper coil increase the surface area for energy transfer - copper is a good conductor of heat - the combustion takes place inside the apparatus, not affected by draught.	[1]
	(d)		To <u>remove sulfur dioxide</u> gas as low concentration of this gas can also irritates the respiratory system.	[1]
				[Total: 10]

7	(a)	(i)	Reaction I: $\text{H}_2\text{N}-\text{NH}_2$ Reaction II: PBr_3	[2]
		(ii)	 E: <chem>OC(=O)CC(O)c1ccccc1</chem> G: <chem>[O-]C(=O)CC(O)c1ccccc1</chem>	[2]
		(iii)	Electrophilic substitution 	[3]
	(b)	1) Test: Add $\text{Br}_2(\text{aq})$. Compound F : Orange $\text{Br}_2(\text{aq})$ decolourises. Compounds B and C : $\text{Br}_2(\text{aq})$ remains orange. 2) Test: Add $\text{AgNO}_3(\text{aq})$ Compound B : No ppt forms. Compound C : Cream ppt (AgBr) forms.		[4]
	(c)	Brick-red precipitate forms. 		[2]
