

1. Types of Organic reaction you need to know

Types of reaction	Sub Reaction	Comments
Substitution (carbon centre is saturated/ resonance stabilised)	<i>Free Radical Substitution</i>	Homolytic fission of alkane leading to unpaired eln. H2 Topic: Alkane
	<i>Electrophilic Substitution</i>	Electrophilic: reacting carbon-centre is eln rich; thus it attacks electrophile. H2 Topic: Arene
	<i>Nucleophilic Substitution</i>	Nucleophilic: reacting carbon centre is eln poor; thus attacked by nucleophile. H2 Topic: Halogenoalkane
Addition (carbon centre is unsaturated)	<i>Electrophilic Addition</i>	Electrophilic: C=C double bond is eln rich, thus it attacks electrophile. H2 Topic: Alkene
	<i>Nucleophilic Addition</i>	Nucleophilic: reacting carbon centre is eln poor, thus attacked by nucleophile. H2 Topic: Carbonyl compound
Oxidation		Either increase in O atom/ decrease in H atom/ increase in OS
Reduction		Either decrease in O atom/increase in H atom/ decrease in OS
Acid base reaction	Bronsted Lowry	Bronsted Acid donates H ⁺ . Bronsted Base accepts H ⁺
	Lewis	Lewis acid accepts eln pair; Lewis base donates eln pair
Hydrolysis		Reaction whereby a molecule is cleaved into two molecules by H ₂ O. Eg: Esters hydrolysis, Amide hydrolysis, Acid chlorides hydrolysis, Nitrile hydrolysis.
Condensation		Reaction between <i>two functional groups</i> to eliminate a small molecule such as water or ammonia. (one of these molecules involve a -C=O group) Eg. Carboxylic acid + alcohol, acid chloride + ammonia, etc)
Elimination		Reaction to remove a small molecule from an organic molecule (eg. Removal of HX from halogenoalkane; H ₂ O from alcohol)
Precipitation		Chemical reaction that cause formation of solid from two aq. Soln.

** for reactions in *italic*, you need to know the mechanism.

2. Common reagents for synthesis

Reagents & Condition	Type of reaction	Functional group	Observations	Products	✓ ?
Section A: Oxidation					
KMnO₄ with H₂SO₄ (aq), heat Or KMnO₄ with NaOH, heat, followed by acidification	Oxidation (Oxidative cleavage)	 Terminal alkene	Decolourisation of purple soln; Effervescence observed.	CO ₂ + H ₂ O	
			Decolourisation of purple soln	RCO ₂ H formed. $\text{CH}_3\text{CH}=\text{CH}_2 + 5[\text{O}] \rightarrow \text{CH}_3\text{CO}_2\text{H} + \text{H}_2\text{O} + \text{CO}_2$ Note: So if elucidation abt vigorous oxidation of alkene shows an increase of 2 O, the alkene contains this feature.	
				Ketone formed. $(\text{CH}_3)_2\text{C}=\text{CH}_2 + 4[\text{O}] \rightarrow (\text{CH}_3)_2\text{CO} + \text{H}_2\text{O} + \text{CO}_2$ Note: So if elucidation abt vigorous oxidation of alkene shows an increase of 1 O, the alkene contains this feature.	
KMnO₄ with H₂SO₄ (aq), heat	Oxidation (Side chain oxidation- occurs when C directly bonded to benzene ring has a H or O directly attached)			Benzoic acid formed. $\text{C}_6\text{H}_5\text{CH}_3 + 3[\text{O}] \rightarrow \text{C}_6\text{H}_5\text{CO}_2\text{H} + \text{H}_2\text{O}$	
			Decolourisation of purple soln; Effervescence observed.	Benzoic acid formed. The rest of the chain get oxidised to CO ₂ & H ₂ O unless question says otherwise	
				Benzoic acid formed. $\text{C}_6\text{H}_5\text{COCH}_3 + 4[\text{O}] \rightarrow \text{C}_6\text{H}_5\text{CO}_2\text{H} + \text{H}_2\text{O} + \text{CO}_2$ Note: Likely to be hinted by the question	

				Benzoic acid formed.	
	Oxidation	Aldehydes, 1° and 2° alcohols	Decolourisation of purple soln	Note: Likely to be hinted by the question Aldehyde → carboxylic acid 1° alcohol → carboxylic acid 2° alcohol → ketone 3° alcohol → no [O] Note: If elucidation shows a gain of 1 O atom during oxidation => likelihood is 1° alcohol	
		Methanoic acid Ethanedioic acid	Decolourisation of purple soln Effervescence observed.	CO ₂ + H ₂ O produced	
Dilute KMnO₄ with NaOH (aq)	Mild Oxidation	Alkenes	Decolourisation of purple soln Formation of brown MnO ₂	Alkene → Diol CH ₂ =CH ₂ + H ₂ O + [O] → CH ₂ (OH)CH ₂ OH	
K₂Cr₂O₇ with H₂SO₄ (aq), Heat,	Oxidation	Aldehydes, 1° and 2° alcohols	Orange soln turns green	Aldehyde → carboxylic acid 1° alcohol → carboxylic acid (with reflux) 1° alcohol → aldehyde (with distillation) 2° alcohol → ketone	
Tollen's reagent (ammonical solution of silver nitrate), Warm		Aldehydes	Silver mirror formed.	Ag ⁺ reduced to Ag RCHO + 2[Ag(NH ₃) ₂] ⁺ + 3OH ⁻ → RCO ₂ ⁻ + 2Ag + 4NH ₃ + 2H ₂ O	
Fehling's Soln (alkaline solution of Copper(II) tartrate), warm		Aliphatic Aldehydes only	Reddish brown soln formed.	Cu ²⁺ reduced to Cu ⁺ in Cu ₂ O RCHO + 2 Cu ²⁺ + 5OH ⁻ → RCO ₂ ⁻ + Cu ₂ O + 3H ₂ O	
I₂(aq) with NaOH, Warm		Ethanol/Alcohols with the structural feature	Yellow crystals of triiodomethane (CHI ₃) formed.	RCH(OH)CH ₃ + 4I ₂ + 6OH ⁻ → RCO ₂ ⁻ + CHI ₃ + 5I ⁻ + 5H ₂ O RCOCH ₃ + 3I ₂ + 4OH ⁻ → RCO ₂ ⁻ + CHI ₃ + 3I ⁻ + 3H ₂ O	

		$\begin{array}{c} \text{CH}_3 \\ \\ \text{---C---OH} \\ \\ \text{H} \end{array}$ Or ethanal/ketones with the structural feature $\begin{array}{c} \text{O} \\ \\ \text{---C---CH}_3 \end{array}$		Synthesis to decrease carbon chain by 1 C.	
Section B: Reduction					
H₂(g) with Ni catalyst	Reduction	Alkenes Aldehydes Ketones Nitriles	-	Alkene → Alkane Aldehyde → 1° alcohol Ketone → 2° alcohol * 1 mol of H ₂ reacts with 1 mol of the above Nitrile → Amine * 2 mol of H ₂ reacts with 1 mol of the above	
LiAlH₄ in dry ether	Reduction	Aldehydes Ketones Nitriles Carboxylic acids Amides		Aldehyde → 1° alcohol Ketone → 2° alcohol Nitrile → Amine Carboxylic acid → 1° alcohol Amide → Amine + H ₂ O 1. RCONH ₂ + 4[H] → RCH ₂ NH ₂ (1° amine) + H ₂ O 2. RCONHR + 4[H] → RCH ₂ NHR (2° amine) + H ₂ O 3. RCONR ₂ + 4[H] → RCH ₂ NR ₂ (3° amine) + H ₂ O Note: LiAlH ₄ only reduce polar bonds, but not nitrobenzene. <i>It may reduce esters to alcohols, if question give context.</i>	
Sn with concentrated HCl, heat Followed by aq. NaOH,		Nitrobenzenes		Phenylamine produced.	

				Note: NaOH is added in 2 nd step to neutralise C ₆ H ₅ NH ₃ ⁺ to liberate phenylamine.	
Section C: Reaction with Na/NaOH/NaHCO₃/Na₂CO₃					
Na(s)	Redox reaction	Alcohols Phenols Carboxylic acids	Effervescence of H ₂ gas	$\text{ROH} + \text{Na} \rightarrow \text{RO}^-\text{Na}^+ + \frac{1}{2} \text{H}_2$ $\text{C}_6\text{H}_5\text{OH} + \text{Na} \rightarrow \text{C}_6\text{H}_5\text{O}^-\text{Na}^+ + \frac{1}{2} \text{H}_2$ $\text{CH}_3\text{CO}_2\text{H} + \text{Na} \rightarrow \text{CH}_3\text{CO}_2^-\text{Na}^+ + \frac{1}{2} \text{H}_2$ Note: $\frac{1}{2}$ mol of H₂ liberated per mol of the organic molecule Na is oxidised, H is reduced.	
NaOH (aq)	Acid base reaction	Phenols Carboxylic acids	Partition of phenols and carboxylic acids from organic layer into the aq. Layer	Phenols $\rightarrow$ Phenoxide + water Carboxylic acids $\rightarrow$ Carboxylate salts + water.	
NaOH(aq), heat	Nucleophilic Substitution/ or alkaline hydrolysis	Halogenoalkanes (where X= Cl, Br, I)	-	Alcohols $\text{RX} + \text{OH}^- \rightarrow \text{ROH} + \text{X}^-$ To distinguish the diff halogenoalkanes, Dil HNO ₃ is added to remove the xs. NaOH, cooled and AgNO ₃ added in to precipitate AgX AgCl: White ppt AgBr: Cream ppt AgI: Yellow ppt	
	Alkaline hydrolysis	Amides	Pungent alkaline gas liberated that turn moist red litmus blue	Ammonia/ Amine produced with carboxylate salt $\text{RCONH}_2 + \text{OH}^- \rightarrow \text{RCO}_2^- + \text{NH}_3$ $\text{RCONHR} + \text{OH}^- \rightarrow \text{RCO}_2^- + \text{NH}_2\text{R}$ (NH ₂ R might exist as a gas, either CH ₃ NH ₂ or hinted by qns)	

		Nitriles Esters	-	$\text{RCN} + \text{OH}^- + \text{H}_2\text{O} \rightarrow \text{RCO}_2^- + \text{NH}_3$ Carboxylate salt and alcohol (or phenoxide salt) Note: 1. phenol deprotonate in presence of aq. NaOH to give phenoxide salt. 2. As water is used in hydrolysis, if need to carry out subsequent test to verify the starting compound is indeed ester, cannot use reagents such as PCl_5 , SOCl_2 etc as they will get destroyed by the moisture from hydrolysis.	
$\text{Na}_2\text{CO}_3(\text{aq})$, $\text{NaHCO}_3(\text{aq})$	Acid-base reaction	Carboxylic acids Acyl Halides (where X= Cl, Br)	Effervescence	Carboxylic acid $\rightarrow$ Carboxylate salt + CO_2 + H_2O $\text{CH}_3\text{COX} \rightarrow$ Carboxylate salt + NaX + H_2O	
NaOH (ethanol), heat	Elimination	Halogenoalkanes		Alkene $ \begin{array}{c} \text{H} & \text{H} & \text{CH}_3 \\ & & \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \\ & & \\ \text{H} & \text{X} & \text{H} \end{array} \longrightarrow \begin{array}{c} \text{CH}_3 & & \text{CH}_3 \\ & \backslash & / \\ & \text{C}=\text{C} \\ & / & \backslash \\ \text{H} & & \text{H} \end{array} + \begin{array}{c} \text{H} & & \text{CH}_2\text{CH}_3 \\ & \backslash & / \\ & \text{C}=\text{C} \\ & / & \backslash \\ \text{H} & & \text{H} \end{array} + \text{HX} $ (Both cis/trans) Note: Elimination is only possible if halogen and hydrogen atom are attached on adjacent carbons.	
Section D: Hydrolysis					
Dilute acids (HCl, HNO_3, H_2SO_4), Heat	Acid Hydrolysis	Nitriles Amides Esters		$\text{RCN} + \text{H}^+ + 2\text{H}_2\text{O} \rightarrow \text{RCO}_2\text{H} + \text{NH}_4^+$ $\text{RCONH}_2 + \text{H}^+ + \text{H}_2\text{O} \rightarrow \text{RCO}_2\text{H} + \text{NH}_4^+$ $\text{RCO}_2\text{R}' + \text{H}_2\text{O} \rightarrow \text{RCO}_2\text{H} + \text{R}'\text{OH}$	
H_2O (l)	Hydrolysis	Acyl Halides (where X= Cl, Br)	**White fumes	Carboxylic acid and hydrogen halides	

				**Note: White fume is observed only with dropwise addition of water, else HCl will dissolve and is no longer observed. Hence, choose another method for distinguishing test if possible.	
AgNO₃ (aq)	Hydrolysis followed by precipitation		AgCl= White ppt AgBr= Cream ppt	Silver halides ppt No need to add OH⁻ or H⁺ as acid halides hydrolyses readily in water.	
Section E: Reaction with Conc Acid					
H₂O(g) with H₃PO₄ catalyst or Cold Conc. H ₂ SO ₄ followed by water, heat	Electrophilic Addition	Alkene		Alcohol Note: Apply Markonikov's rule (Add H to the C containing more no. of H in C=C to get the more stable carbocation)	
Concentrated H₃PO₄ catalyst and heat Or Excess conc H ₂ SO ₄ , heat	Elimination	Alcohols		Alkene: $ \begin{array}{c} \text{H} & \text{H} & \text{CH}_3 \\ & & \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \\ & & \\ \text{H} & \text{OH} & \text{H} \end{array} \longrightarrow \begin{array}{c} \text{CH}_3 & & \text{CH}_3 \\ & \diagdown & / \\ & \text{C}=\text{C} & \\ & / & \diagdown \\ \text{H} & & \text{H} \end{array} + \begin{array}{c} \text{H} & & \text{CH}_2\text{CH}_3 \\ & \diagdown & / \\ & \text{C}=\text{C} & \\ & / & \diagdown \\ \text{H} & & \text{H} \end{array} + \text{H}_2\text{O} $ Note: Only possible if -OH and hydrogen atom are attached on adjacent carbons.	
Conc. H₂SO₄, heat with reflux	Condensation	Alcohols Carboxylic acid		$\text{RCO}_2\text{H} + \text{R}'\text{OH} \rightleftharpoons \text{RCO}_2\text{R}' + \text{H}_2\text{O}$ Conc. H₂SO₄ used as a dehydrating agent as well as a catalyst. Reaction does not proceed with phenol.	
Conc. HNO₃ (with Conc. H₂SO₄) 50°C - Benzene 30°C- alkylbenzene	Electrophilic substitution	Benzene, Alkyl Substituted benzene ring		Nitrobenzene or alkyl nitrobenzene In the reaction, the electrophile is ⁺NO₂	

Dilute HNO ₃		Phenol (-OH group activate the ring)		Either 2-nitrophenol or 4-nitrophenol is obtained.	
Section F: Reaction with bromine/ halogen					
Br ₂ (l) in CCl ₄	Electrophilic Addition	Alkenes	Decolourisation of reddish brown Br ₂	Dibromo-alkane obtained.	
Br ₂ (l) UV Light	Free radical Substitution	Alkanes		Use limited Br ₂ or excess alkane if mono-sub is preferred. If not, poly substitution will take place. Note: Avoid FRS as much as possible in synthesis, as a mixture of products can be expected.	
Br ₂ (with FeBr ₃ / A/Br ₃) or Cl ₂ (with FeCl ₃ or A/Cl ₃)	Electrophilic Substitution	Benzene Substituted Benzene		Mono-brominated benzene/ benzene derivative obtained. In the reaction, the electrophile is ⁺ Br	
Br ₂ (aq)	Electrophilic Addition	Alkene	Decolourisation of orange Br ₂	In <i>symmetrical alkene</i> , Bromohydrin formed as the major product CH ₂ =CH ₂ + Br ₂ (aq) → CH ₂ (OH)CH ₂ Br + HBr. Disubstituted bromine as the minor pdt. In <i>unsymmetrical alkene</i> , Br will add to the C(of the C=C double bond) with more no. of H while H ₂ O will act as the nucleophile in the 2 nd step, to obtain the major product. CH ₃ CH=CH ₂ + Br ₂ (aq) → CH ₃ CH(OH)CH ₂ Br + HBr	
	Electrophilic Substitution	Phenols Phenylamine	Decolourisation of orange Br ₂ **Formation of white ppt	Tri-bromination has taken place. *2,4,6 tribromophenol or 2,4,6 triphenylamine obtained. Note: * the number of Br attached in the product tells you how many of the 2,4,6 sites are already occupied with a side chain.	

				** white ppt may be observed for large molecules, not necessarily just 2,4,6 tribromophenol or 2,4,6 triphenylamine No catalyst required due to strongly activating –OH and –NH ₂ .	
Section G: Reaction with Ammonia/ amine/nitrogen containing reactants					
NH₃	Acid-base reaction	Carboxylic acids		Carboxylate salt obtained	
	Condensation/	Acid halides (where X= Cl, Br)	White fumes	Primary amide is obtained.	
NH₃ dissolved in ethanol, heat in a sealed tube	Nucleophilic substitution	Halogenoalkanes		When excess ammonia or limited halogenoalkane used; $2\text{NH}_3 + \text{RX} \rightarrow \text{RNH}_2 + \text{NH}_4\text{X}$	
Amine dissolved in ethanol, heat)				When excess halogenoalkane used, further sub take place $\text{RNH}_2 + \text{RX} \rightarrow \text{R}_2\text{NH} + \text{HX}$ (1° amine → 2° amine) $\text{R}_2\text{NH} + \text{RX} \rightarrow \text{R}_3\text{N} + \text{HX}$ (2° amine → 3° amine) $\text{R}_3\text{N} + \text{RX} \rightarrow \text{R}_4\text{N}^+ + \text{X}^-$ (3° amine → 4° ammonium salt) Quarternary ammonium salt is possible as the end pdt.	
KCN/NaCN in ethanol, heat	Nucleophilic Substitution	Halogenoalkanes	-	Nitriles formed Note: step up reaction	
Trace amount of NaCN, HCN, cold (Alternative: Trace amt of NaOH, HCN)	Nucleophilic Addition	Aldehydes/ ketones	-	Formation of cyanonitrile. $\text{CH}_3\text{COCH}_3 + \text{HCN} \rightarrow (\text{CH}_3)_2\text{C}(\text{OH})\text{CN}$ Note: step up reaction, with an increase of one functional group	

2,4,Dinitrophenylhydrazine	Condensation	Aldehydes/ Ketones	Orange ppt formed	Formation of hydrazine derivative 	
Section H: Reaction with HX/PX₃/PX₅					
HBr (g) or HCl(g)	Electrophilic Addition	Alkenes	-	Halogenoalkanes obtained In unsymmetrical alkene, the H will add to the C(of the C=C double bond) with more no. of H while the X will add to the C with less no. of H to obtain the more stable carbocation intermediate.	
HBr (g)	Nucleophilic Substitution	Alcohols	-	Halogenoalkanes obtained.	
PCl₃ or PCl₅ or PBr₃ or SOCl₂ Anhydrous conditions		Alcohols Carboxylic acids	White fumes	Alcohol → halogenoalkanes $\text{ROH} + \text{PCl}_5 \rightarrow \text{RCl} + \text{POCl}_3 + \text{HCl}$ $\text{ROH} + \text{PBr}_3 \rightarrow \text{RBr} + \text{H}_3\text{PO}_3$ Carboxylic acid → Acid halides $\text{RCO}_2\text{H} + \text{SOCl}_2 \rightarrow \text{RCOCl} + \text{SO}_2 + \text{HCl}$
